to the Commission**
Rule 130
Mireille D'Ornano (ENF)

Subject: Vaccines containing aluminium salts

Although a number of serious scientific studies have shown a causal link between the presence of aluminium salts in vaccines and higher rates of autism in the countries which use them the most, the public health issue is still not taken seriously.

While grassroots organisations are fighting to have the precautionary principle applied, the Commission shows little concern. Muscular and joint pain, chronic fatigue, insomnia and neurocognitive disorders should compel the Commission to weigh up the benefits of vaccines containing aluminium salts against the risks of their use.

- 1 Can the Commission produce an independent report on the toxicity of aluminium salts and their correlation with higher rates of autism?
- 2 Can it give its reasons for authorising the marketing of vaccines containing aluminium salts?
- 3 When authorising the vaccines, did the Commission uncover any possible risks linked to aluminium salts?
