Subject: Measures to regulate fisheries

Croatian catches from trawler fishing over the last 30 years have accounted for between 10% and 15% of catches on the Adriatic Sea and, as such, could not have resulted in the overfishing of resources shown in a report drawn up by scientists (Institute of Oceanography and Fisheries in Split) monitoring the status of resources in the Adriatic Sea under the Adriamed project.

Will any reduction of fishing effort or catches take into account the responsibility of individual countries' fleets for the current state of affairs? Will the restrictions placed on them be proportionate to the level of responsibility they bear for the current status of resources?
